

ROD TECHNOLOGY

	Heavy Duty, Wind-On and Super Heavy Duty black and silver finished rollers are used exclusively on TCurve Tiagra rods above eight kilo line class. Designed for heavy lines and knot clearance, and made in America from only the finest materials, the AFTCO guide is a cornerstone product of the game fishing industry.
	The world's most trusted aluminium detachable butts are used on all two-piece TCurve Tiagra rods including short curved and big game curved butts for the appropriate line classes.
	The latest Alps CAH reel seats are leading edge in both design and appearance, made with the best marine grade light alloy and a high quality anodised surface. Designed with striking inserts to match our rod cosmetics, they feature cushion hood inserts to match both spinning and overhead reels in a non-corrosive manner.
	The unique C4S construction utilises a high modulus graphite blank as a base, which is then cross-wrapped with extra layers of graphite, producing a finished rod that has graphite sensitivity with extra hoop strength and increased robustness.
	Custom Carbon Slick Butt: Use of an extra strong carbon sleeve to replace conventional PVC piping, results in a stronger, lighter and an aesthetically pleasing slick butt.
	Customised EVA grips, shaped for maximum comfort and performance.
	Light, flexible, fibreglass blanks.
	Fuji reel seats deliver unparalleled strength without sacrificing lightness, and their innovative and unique designs have long been recognised as the only choice when it comes to bringing out the very best in high performance fishing rods.
	Fuji is a pioneering and trusted name in rod guides. Their revolutionary anti-tangle K series guides with SiC rings feature on Ocea Switch Bait rods, while the K frame guides with Alconite inserts are used on Anarchy, Ocea Offshore, Terez, Deep Jig, Bluewater, TK3G and 3Zero rods.
	Utilising high quality graphite sheets rolled on custom designed mandrels, to create sensitive yet extremely light-weight high performance fishing blanks.
	Rod blanks combining both graphite and fibreglass materials in a particular manner can create a blank with characteristics that are the best of both worlds, making a rod that has fibreglass robustness with the power of graphite.
	Grip Painted: Surface area adjacent to a join on a multi-piece rod, which has a rough painted surface to help grip while disassembling rod for stowage or travel.

	Lightweight support construction reinforces the blank's torsional rigidity, so casting accuracy and distance is improved.
	High modulus graphite construction.
	Applying high pressure during the baking process evenly distributes the resin throughout the blank which eliminates weak spots, and can increase blank strength by up to 40%.
	To obtain a super flexible rod action for bait fishing, a soft, solid fibreglass tip section is inserted into a specially designed graphite blank, creating a lightweight, powerful rod that also allows a timidly biting fish to hook itself without feeling the stiff part of the blank action.
	Using a complex rod blank manufacturing technique, a solid fibreglass tip section is woven into a tubular blank during the early stages of construction, producing a strong blank with a solid tip that is as tough as they come!
	With over 25 years of tradition, Pac Bay is fast becoming one of the big innovators in fishing rod componentry. This internationally recognised brand makes quality reel seats and rod guides, which are utilised on all our TCurve Revolution rod ranges.
	By applying a special surface treatment Shimano have succeeded in making natural cork more durable. Power cork is tactile, ergonomic, lightweight and attractive, and yet it will not absorb moisture, is more resistant to bacteria and will not degrade or age cosmetically. Power cork is also washable and will maintain its looks for years to come.
	A technology where the manipulation of graphite on an atomic level delivers lighter, stronger and more durable fishing rods.
	Cork is tactile, ergonomic, light-weight and attractive, and yet it will not absorb moisture, is more resistant to bacteria and will not degrade or age cosmetically.
	Sea Guides' extensive lineup of rod guides and ceramic inserts are of the highest calibre in craftsmanship, detail and performance.
	Using separate grip materials for a butt grip and a reel seat grip allows for a more comfortable rod when casting, reduces unwanted grip materials and enhances the appearance of the overall handle.
	Fundamental reinforcement of lightweight blanks increases torsional and compression rigidity. Casting accuracy and distance is improved, as is lifting power and limit strength.
	Shimano's famous TCurve material, built with a three-ply construction technique, transforms power and strength into a beautiful lightweight blank.
	Shimano has engineered TC4 construction to create an extremely durable yet light rod with a crisp feel. Based on double inner layers of advanced, dynamic T Glass, over-wrapped with a spiral of high-modulus graphite, this blank delivers super high performance that, when used with specific rod actions, is ideal for fishing braided lines.
	Hard-wearing shaped timber is used for the butt end of surf and rock rods as a lasting and corrosion-free component against the rigours of sand, rocks and water.
	Webo reel seats are made from premium grade materials and are tested well beyond their required strength.
